TITLE: Nitro derivatives of benzotrichloride

SOURCE: Ukrainskiy khimicheskiy zhurnal, v. 32, no. 8, 1966, 849-852

TOPIC TAGS: organic nitro compound, halogenated organic compound, mixed halogenated
organic compound

ABSTRACT: An attempt was made to find new methods of preparing nitro derivatives of benzotrichloride. Nitration of benzotrichloride was carried out by using pure nitric acid and nitrating mixtures of various compositions. With HNO_3 alone, taken in amounts of 10-30 moles per mole of benzotrichloride, even at $-20^\circ C$ a considerable hydrolysis of the trichloromethyl group takes place, and the yield of the products, a mixture of isomeric nitrobenzotrichlorides, does not exceed 30%. The optimum nitrating mixture consists of 25% HNO_3 and 75% H_2SO_4 (by weight), 3 moles of HNO_3 being taken for 1 mole of benzotrichloride. The yield of isomeric nitrobenzotrichlorides then exceeds 90%, and the isomers consist of 16.8% ortho-, 20.7% para- and 62.5% metanitro derivatives. Fluorination of p-nitro- α,α,α -dichlorobromotoluene with antimony trifluoride and anhydrous HF produced p-nitrobenzotrifluoride in good yield. The substitution of fluorine

TITLE: Reduction of the capture gamma radiation from structural reactor materials by screening the materials with boron-containing screens

SOURCE: Atomnaya energiya, v. 18, no. 1, 1965, 69-70

TOPIC TAGS: reactor shielding, ¹⁹ capture gamma radiation, boron shielding

ABSTRACT: The authors point out that earlier experimentally determined coefficients expressing the decrease in the intensity of capture gamma rays from reactor construction materials were obtained for only one particular case, where the gamma detector was located at approximately half the mean free path from the surface of the

Card 1/3

L 26914-65

ACCESSION NR: AP5004010

source, whereas the coefficient of reduction of the capture gamma dose (blocking coefficient) was really a function of the thickness between the source and detector. They have calculated with an electronic computer the spatial and energy distributions in steel screens and in the reactor shell using an 18-group method in the P_2 approximation, for the case of a reactor with and without a boron-containing screen. It has been shown earlier that leakage of neutrons gives rise to capture gammas in the reactor shell, which increases the gamma level outside the reactor. The calculations show that the decrease in the capture gamma radiation is quite rapid until a value of 4 mean free paths is reached, after which the coefficient becomes independent of the thickness. "The authors thank S. G. Tsykin and Yu. A. Kazanskiy for interest in the work and for critical remarks." Orig. art. has: 2 figures and 1 formula.

TITLE: Angular and energy distribution of gamma radiation on the
surface of a volume source

SOURCE: Atomnaya energiya, v. 19, no. 2, 1965, 179-180

TOPIC TAGS: nuclear reactor, gamma radiation, nuclear physics apparatus

ABSTRACT: Many layers of material are usually placed in nuclear reactors between the reactive core itself and the outside surface of the shield. Therefore, various attenuation processes must be taken into account in calculations of biological shielding. The authors investigated the angular and energy distribution of gamma radiation on the outside surface of the reactor. The results of their research are given for two cases. In one case, the reactor vessel was protected in water by a boron shield while in the other case no boron shielding was provided. The Monte Carlo method was used for calculations by means of M-20 electronic computing machine. It was assumed, that the gamma rays were generated at the initial energy levels of 2, 3, 4, 5, 6 and 7 Mev.

The greatest statistical error after 12000 tests was less than 25% for angular and 20% for energy distributions. The distributions applied to two above mentioned cases and seven energy levels were illustrated by two sets of histograms. The attenuation of 7 Mev gamma radiations in lead shields was also analyzed. The results of this analysis expressed in dose rates were tabulated and graphically illustrated.

AUTHOR: Sologub, D. P. and Fomin, A. G., Engineers

TITLE: Machine Tool for Oxygen-cutting Pipe

PERIODICAL: Svarochnoye Proizvodstvo, 1959, Nr 6, p 41 (USSR)

ABSTRACT: A new type of machine-tool is described for tubes with a diameter of 100-500 mm which has been invented, constructed and introduced by the Machine-Building Plant imeni Ordzhonikidze, Podol'sk. The Plan of the work-bench is given in Figure 1. Figure 2 is a photograph of the work-bench. The authors state that the new work-bench introduced by this plant renders a possibility of mechanical cutting by a tube oxygen-cutting machine instead of manual cutting. In applying the new work-bench the working productivity is raised 2 to $2\frac{1}{2}$ times. there is 1 diagram and 1 photograph.

Abstract : The isolated blended trunk of a frog's sciatic nerve served as the object of investigation. In some of the experiments, individual spinal cord nerve roots (VIII-X) were irritated by electric impulses and the biopotentials of tibial and fibular nerves were recorded, as well as of the tibial nerve's deep branch. Weak (100 mv) and moderate frequency impulses (30 imp/sec) produced an initial transformation. Medium strong impulses (200-300 mv) produced a number

BAUTHOR: Sologub, M. I.ORG: State University im. A. A. Zhdanov, Leningrad (Gosudarstvenny universitet)TITLE: Intracellular rest potentials of surviving sensory neurons

22

SOURCE: Fiziologicheskiy zhurnal, v. 51, no. 6, 1965, 686-692TOPIC TAGS: neuron, electrophysiology, neurophysiology

ABSTRACT: The intracellular rest potentials (RP) of sensory nerve cells VIII and IX of the spinal ganglion of frogs that had been isolated together with the peripheral nerve and anterior radix and placed into a flowing Ringer solution were determined by means of microelectrodes during the process of survival (5 min - 4 hrs). The initial value of RP reached 70 mv. It then increased, sometimes up to 80 mv, and after this decreased to a critical level, whereupon a precipitate drop took place. In some experiments the sign of the RP was reversed after the precipitate drop and the value of RP returned to zero. The abrupt decrease of RP followed by a reversal of sign resembled those observed in connection with generation of an action potential, so that a common mechanism for the two processes may be assumed that is associated with entrance of Na^+ ions into the cell. On

the basis of the experimental results and data given in the literature, the following five-stage sequence of changes in the RP, which reflects alterations in the functional state of the cell under the effect of factors of the environment, apparently occurs in surviving cells of all types (nerve cells, muscle fibers, etc.):
1) an increase in RP; 2) a stage of stable RP; 3) a slow decrease of RP to a critical level; 4) a precipitate decrease of RP; 5) reversal of RP. Orig. art. has: 3 figures and 1 table. [JPRS] O

Measurement of the Micro Hardness of Samples With a Length up to 300 mm (Izmereniye mikrotverdosti obraztsov dlinoy do 300 mm)

PERIODICAL:

Zavodskaya Laboratoriya, 1958, Vol 24, Nr 12,
pp 1521 - 1522 (USSR)

ABSTRACT:

The determination of the micro hardness of samples of larger dimensions (Refs 1,2) must be carried out on the PMT-3 apparatus with varying degrees of difficulty. To measure cylindrical test objects (diameter - 12 mm, length- 300 mm) in the work reported here the tube of the PMT-3 apparatus was combined with the essential sections of the UIM-21 universal microscope (Fig 1). This tube was fastened to the tube of the microscope using a specially prepared fastener in place of the ocular head piece (Fig 2). The infallible calculating apparatus beside the microscope makes possible a quick and exact placement of the test object under the edge of the

Card 1/2

Measurement of the Micro Hardness of Samples With a Length SOV/32-24-12-41/45
up to 300 mm

diamond pyramid by a displacement of the microscope stage. According to a report by Ye. S. Berkovich (Ref 4) vibrations from the PMT-3 apparatus can lead to measurement errors in testing. The sensitivity of the described arrangement was investigated and it was found that there were no observable vibrations of the diamond pyramid. There are 2 figures and 5 Soviet references.

Simplifying the Shape of Samples for Testing Metals for Fatigue
(Ob uproschchenii formy obraztsov dlya ispytaniy metallov na
ustalost')

PERIODICAL:

Zavodskaya Laboratoriya, 1959, Vol 25, Nr 4, pp 469-470 (USSR)

ABSTRACT:

III
Fatigue samples which have no head pieces but have the same cross section for the whole length are easier to be handled. To avoid a fracture of the samples of this kind in the supports, samples made of the heat-resisting alloy EI 435 and duralumin D 1 were hardened by rolling on the machine NU before the transverse-fatigue tests. The rolling was done on an arrangement (according to Ref 1) with rollers of steel ShKh 15 (diameter = 20 mm, profile radius = 6 mm). The tests in which V. Ya. Slobodyanyuk took part showed that the desired effect was reached with EI 435 whereas the duralumin samples broke. For this reason, the processing conditions of the latter were changed, and the following values were established as the best: rotation speed of the sample 120 rpm, feeding of the rollers 0.5 mm/rev,
